

License Management Module

Who has what?

Keep track of software licenses.

The administration of the software licenses begins with the decision for a software system, purchase of the licenses and agreement of a maintenance contract.

Things that are easy to understand at the beginning will become difficult over time due to the constant changes.

The number of users varies. The software versions or service packs or hotfixes are updating. The different software systems have separate maintenance due dates.

Each vendor has a different portal where the licenses and their terms are mostly found, but they do not help with maintenance renewal or changing the number of users.

Our xRM license management module uses a CRM regular entity, which we have extended with some features. You can manage various products for yourself or your customers, partners.

The maintenance extensions are made per product, and on renewal, the historical data is kept with an expired status.

So you can always understand which licenses were used for which price in which version and for which some users.

If you increase the use of software for a specific version or number of users, the license overview automatically updates to the latest and current version.

The overview also includes the budget to set for software in the period you want to query.

If you are interested in this module or other solutions, we will gladly send you an overview of our CRM system.

You will always receive further information in a personal conversation.
